

the idea book product

Hayes International

Hayes Single-Level roll formers provide a highly cost-effective roll forming line for the production of roofing panel profiles. An integrated uncoiler and stationary shear are standard equipment. Hayes Dual-Level roll formers share the same basic design as the single level models but produce two profiles within the same

floor space. They have two levels of dedicated tooling, top and bottom in-feed guides, a double-acting stationary shear and twin independent drive units. www.bradburygroup.com

Malco Products, Inc.

A compact Malco TSMD Double-Cut TurboShear cleanly navigates 90° outside angles of standing-seam panels. When paired with a Malco DEFT 24-inch or DEFT1 18-inch Folding Tool and SG11 Seamer with Vinyl Gripped Jaws, this trio is a complete system for making perfect drip edges in standing seam panels. Add a hand-operated ER3 Edge Roller to make precise trim-edge bends in standing seam and you have an arsenal of labor saving

Malco options from which to choose. www.malcoproducts.com
